# ATM Transactions

Problem Statement:

- User should be able to insert card and perform transactions

- ATM should authenticate user on the basis of the PIN entered

- Once authenticated user should be able transactions, namely **view account balance**, **deposit cash** and **withdraw cash**

- User can only perform one transaction at any given time

- At the end of a transaction, appropriate messages should be displayed to the user to communicate the success/failure of the transaction

- At the end of a transaction, user should be able to start another transaction

- Card should be returned when user exits
